States of Matter

All Particles are what materials are made from. They are so small that we cannot see them with our eyes. The properties of a substance depend on what its particles are like, how they move and how they are arranged,

Particles behave differently in solids, liquids and gases.

In a solid state, the particles are packed closely together and in a pattern. A solid object holds its shape.

In a liquid state, the particles are close together but can move over each other. A liquid can be poured and will fill the shape of the container.

In a gas state, the particles are spread out and move in all directions. A gas would escape and fill a space.

The temperature at which water turns to ice is called the freezing point. This happens at 0°C.

The temperature at which water turns to steam is called the boiling point. This happens at 100°C.

The main stages of the water cycle are evaporation, condensation, precipitation and collection. The stages of the water cycle work together in a continuous process of recycling Earth's water supply.

History

Study of local history: The Triple Trawler Disaster, The Headscarf Revolutionaries

Some fishing boats are called 'trawlers' because they use a 'trawl-net' to catch the fish

During the 1850s there were almost 8,000 trawlermen who worked out of Hull.

Life at sea was incredibly hard, with men working for three weeks before coming home for about three days.

In 1968 three trawlers from Hull sank within a few weeks of each other and 58 men lost their lives.

A memorial service was held in 1968 to commemorate the lives of those lost in the Triple Trawler
